

An experimentally-validated multi-scale materials, process and device modelling & design platform enabling non-expert access to open innovation in the Organic and Large Area Electronics Industry (MUSICODE)

Grand Agreement: 953187

Project Start Date: 01/01/2021

Project Duration: 48 months

Deliverable 3.6

Model validation by characterization of OLAE & PPV devices (2 of 2)

Date: 20-01-2024

This project has received funding from the European Union's Horizon 2020 Research and Innovation Programme under the Call DT-NMBP-11-2020 "Open Innovation Platform for Materials Modelling"

Project co-funded by the European Commission within Horizon 2020 Research and Innovation Programme		
Dissemination Level		
PU	Public	
PP	Restricted to other programme participants (including the Commission Service)	
RE	Restricted to a group specified by the consortium (including the Commission Services)	
CO	Confidential, only for members of the consortium (excluding the Commission Services)	x

Deliverable author(s): S. Jenatsch, Fluxim AG

Contributors:

Name	Organization
V. Wickrama Appuhamilage, D. Kutsarov, A. Panagiotopoulos, R. Silva	USUR
K. Kaklamanis, D. Papageorgiou, A. Mourkas, C. Prouskas, N. Kalfagiannis, E. Lidorikis	UoI
C. Vael-Garn	Fluxim
E. Doudis, A. Laskarakis, S. Logothetidis	AUTH
V. Kyriazopoulos	OET

Draft Revisions: 03/01/2024, v1.0 prepared by Fluxim
 15/01/2024, v1.1 finalized by UoI
 20/01/2024, v2.0 approved by coordinator

Publishable summary	4
1. Introduction	5
1.1 Objectives of WP/Task.....	5
1.2 Purpose of this Document.....	6
2. Methodology.....	7
2.1 Energy levels.....	7
2.2 Charge carrier mobility.....	7
2.2.1 Limitations of the analytical approaches.....	8
2.2.2 Fitting protocol using multiple curves and analytical formula.....	17
2.2.3 Examples of fitting experimental JV curves.....	19
2.2.4 Fitting with full device model (DD fit)	19
3. Results	20
3.1 Energy levels.....	20
3.2 Charge carrier mobility.....	22
3.2.1 Device modelling of PCDTBT HOD device.....	25
3.2.2 PPDT-2FBT HOD devices.....	34
3.2.3 Device modelling of IDIC EOD device	37
3.2.4 Ongoing device modelling of L8BO EOD device	44
3.2.5 PC70BM EOD devices	45
3.2.6 BTP-12 EOD devices.....	49
3.3 Link to DMS.....	53
4. Model Validation	54
4.1 Energy levels in condensed phase.....	54
4.2 Charge transport and mobility	57
5. Discussion.....	60
5.1 Achievements	60
5.2 Risks	60
5.3 Next steps	60
5. Conclusions	61
References.....	62

Publishable summary

This document reports the work carried out in Task 3.3 “Electrical characterization for model validation (M1-36)” under the WP3 “Model validation by analytical characterization (M1-M36)”. WP3 conducts experimental tests and characterization to validate the models of WP2. Task 3.3 focuses on the opto-electrical characterisation of the OE materials and devices.

This report shows the theoretical and experimental work undertaken in Task 3.3. Energy levels are determined in the solid state from cyclic voltammetry. Moreover, single-carrier devices have been fabricated and characterized by the partners involved to determine the charge carrier mobility of donor and acceptor materials. Different methods have been employed starting from analytical models to full device simulations, to overcome method-specific limitations. The determined mobilities for a set of commonly employed active materials for organic solar cells are presented. The results are compared to modelling work from WP2 and literature values.

The experience gained with the characterisation and analysis methods for material parameters (charge carrier mobility, energy levels, etc) are also employed in the user-cases in WP6. To facilitate a roadmap, develop repeatable processes, and standardize characterisation methods for this, all partners collaborated during monthly meetings in WP2, WP3 and WP6 to discuss device structures, problems, suggest analysis methods and propose mitigation strategies.
